Myths and Truths: The «Law and Finance Theory» Revisited
Abstract:
The "law and finance theory" predicts that the common law system provides the best basis for financial development and economic growth, followed by Scandinavian and German origin civil law and finally French origin civil law. Referring to a number of sceptical views, this paper argues that the theory faces an identification problem, since the majority of common law countries have a market-based financial system, whereas the majority of civil law countries have a bank-based financial system. Moreover, there are plausible alternative hypotheses to explain the quality of the financial system; but that they cannot rule out that the theory refers to a relevant link between the legal tradition and financial development. Finally it is argued that the corner stone of the law and finance theory is the proposition that different legal traditions imply different degrees of investor protection. It is demonstrated that a few minor, but sensible modifications in aggregating the original indicator set produce results that are different from those reported so far and contradictory to the theory's ranking of the four major legal families in terms of investor protection. Accordingly, the validity of the theory's investor protection measures for international comparisons, the supremacy of the common law legacy in protecting investors and, consequently, the validity of legal origin variables to instrument for financial development, have to be regarded as myths rather than truths.

Keywords: Financial Development, Legal System, Investor Protection
1 Introduction

The "law and finance theory" argues that the legal system, which today's countries inherited from the past, is crucial in the way it is favouring financial development. Moreover, since financial development is now widely regarded as a major driving force of economic growth, the legal system is perceived as an ultimate cause of economic growth and development. The alleged causal chain thus runs from the legal origin to financial development and finally to economic growth. Moreover, this theory identifies two dominating legal traditions, a common law tradition inherited from England, and a civil law tradition that is going back to 19th century codifications in France, Germany and Scandinavia. The major conclusion of this theory is that the common law system provides the best basis for financial development and economic growth, followed by Scandinavian and German origin civil law and finally French origin civil law.

This paper will first summarise the main assumptions, hypotheses and findings of the law and finance theory. It will then review some of the critical views. Finally, it will take a closer look at the data that form the backbone of the law and finance theory. It will be shown that major predictions of the theory are not as firmly supported by the data as the proponents claim, so that they are myths rather than truths.

2 The law and finance theory

The law and finance theory can be traced back to two seminal and widely cited papers by La Porta, Lopez-de Silanes, Shleifer and Vishny (La Porta et al. 1997, 1998, henceforth LLSV). After less than ten years, the law and finance literature has already reached some maturity and produced its first synthesis, an extensive handbook survey. Written by two insiders, Beck and Levine's article "Legal Institutions and Financial Development" (2003) for the forthcoming "Handbook of New Institutional Economics" gives an authoritative overview over this research programme, its foundations, underlying assumptions, the data it analyses and its main findings.

To start with, Beck and Levine (2003, p. 1) decompose the law and finance theory into two core arguments. The first states that "in countries where legal systems enforce private property rights, support private contractual arrangements, and protect the legal right of investors, savers are more willing to finance firms and financial markets flourish." Obviously, this is a priori reasoning, formulating a condition to achieve an outcome, and though I would consider legal protection to financial investors to be a necessary rather than a sufficient condition for flourishing financial markets, it is certainly true that better legal protection will make potential investors ceteris paribus more willing to invest. This argument is thus not particularly remarkable.

The more important contribution of the law and finance theory comes with the second of its core arguments, stating that "the different legal traditions that emerged in Europe over previous centuries and were spread internationally through conquest, colonization, and imitation help explain cross-country differences in investor protection, the contracting environment,
and financial development today." This is an original idea, and while the first argument is quasi tautological, the second allows straight-forward predictions about relative levels of financial development across the world's countries and is hence empirically testable.¹

How could a theory, advanced by a handful of researchers,² that refers to the legal tradition of countries, a topic which is clearly not a main preoccupation of economists, be such a quick success? Its appeal to economists is probably due to the transmission channels that it proposes. In particular, the theory states two mechanisms, (1) a political mechanism that works through the way that "legal traditions differ in terms of the priority they attach to private property vis-à-vis the rights of the State and ... the protection of private contracting rights", and (2) an adaptability mechanism, referring to the degree of formalism in the legal system that, if overdone, may impair the legal system's capability to "minimize the gap between the contracting needs of the economy" and the normative status quo (BECK AND LEVINE 2003, p. 1). Now, property rights and administrative formalism are clearly notions to attract the profession's attention. From an economist's perspective, financial transactions and contracts are plagued by informational asymmetry and moral hazard and it is the function of property rights to ameliorate these risks. To the degree that the legal system offers effective protection against the occurrence and, if necessary, the consequences of these types of market failure, financial investors will be more inclined to lend, be it to financial intermediaries or directly on the financial market.

The law and finance theory hence addresses the legal protection of lenders and shareholders. And since corporate finance is trivial with a single majority shareholder, the law and finance theory is particularly interested in whether managers or controlling shareholder are "in a position to expropriate minority shareholders and creditors" (op. cit., p. 4), i.e. to which degree the legal system offers protection against theft, transfer pricing, asset stripping and related practices and how bankruptcy laws deal with creditors. Accordingly, the theory focuses on both shareholder protection ("anti-director rights") and creditor protection ("creditor rights") as well as on the degree to which the legal norms are effectively enforced.

A key notion of the theory is the distinction between insiders (stakeholders, "the State") and outsiders (shareholders as well as creditors). The micro foundation of this approach is the willingness to invest, so that the legal system's support to outsiders is seen as beneficial, whereas a strong position of insiders is regarded as detrimental to financial development.

The innovative addition of the law and finance theory to these established ideas and assumptions lies in the way it combines them with its peculiar view on legal history. Let us therefore take a closer look at how the theory deals with the historical legacy of law.

2.1 The main legal traditions

The characterisation of the world's major legal traditions is an important element in the key texts of the law and finance theory. Lucidly summarising findings of scholars of law and history and presenting them from a corporate finance perspective, the authors are telling a fasci-

¹ For a profession that is still plagued by "model platonism" (ALBERT 1966), one of the noteworthy merits of the law and finance theory is that is has provided a set of thought-provoking and testable hypotheses.
² The impressive number of publications that form the main body of the finance and law theory may obscure the fact that its agenda setting authors are a relatively small group of closely collaborating, extremely productive (though sometimes a bit repetitive) and skilful writers.
nating and coherent story. To reproduce the argument in the original spirit of the theory, the two following paragraphs refer closely to Beck and Levine's survey.

2.1.1 Common law

Common law has its roots in England. It "spread through colonization and conquest to all corners of the world" and can therefore be assumed to be more or less familiar to Anglophone economists. The law and finance theory is hence comparatively short in describing its origin and practice. On the other hand, it emphasises two "unique" features: "(a) the relationship between the State and the Courts and (b) jurisprudence. From 1066, the English law evolved based on the resolution of specific disputes and increasingly stressed the rights of private property [and] the courts developed legal rules that treated large estate holders as private property owners and not as tenants of the king. Indeed, the common law at the dawn of the 17th century was principally a law of private property. ... In terms of legal formalism, English law typically imposes less rigid and formalistic requirements on the presentation of evidence, witnesses, etc., and instead offers judges greater latitude. ... In terms of jurisprudence, the English common law tradition is almost synonymous with judges having broad interpretation powers and with courts molding and creating law as circumstances change. The common law is obsessed with facts and deciding concrete cases, rather than adhering to the logical principles of codified law." (BECK AND LEVINE 2003, p. 9 f.)

The law and finance theory's interpretation of the uniqueness of common law thus highlights the protection of private property rights and a low degree of formalism.

2.1.2 Civil law

The theory of finance's characterisation of civil law is more complex. This legacy is traced back to the Roman Empire, the first society with a positive law. In BECK and LEVINE'S words (op. cit., p. 5 ff):

"When Emperor Justinian had the Roman law compiled in the sixth century, he attempted to implement two substantive modifications. First, while Roman law placed the law above all individuals, the Justinian texts placed the emperor above the law. Second, Justinian broke with Roman law by attempting to eliminate jurisprudence. Roman law had developed over centuries on a case-by-case basis, adjusting from the needs of a small farmer community to the needs of a world empire with only a minor role left for formal legislation. Justinian changed this doctrine".

In this view, the Roman legacy consists of two elements, a strong position of the central power to decree laws and rules and strict adherence to this given, positive corpus of law. Let us now see how this legacy shaped the major sub-groups of the civil law family.

"France’s legal system evolved as a regionally diverse mélange of customary law, law based on the Justinian texts, and case law ... [B]y the 18th century, there was a notable deterioration in the integrity and prestige of the judiciary. The Crown sold judgshiips to rich families and the judges unabashedly promoted the interests of the elite and impeded progressive reforms. Unsurprisingly, the French Revolution turned its fury on the judiciary and quickly

---

3 See e.g. LLBV (1998, p. 117–121) and BECK AND LEVINE (2003, p. 5–13).
strove to (a) place the State above the courts and (b) eliminate jurisprudence. Codification under Napoleon supported the unification and strengthening of the State and relegated judges to a minor, bureaucratic role. According to the theory underlying the French Civil Code, the legislature drafts laws without gaps, so judges do not make law by interpreting existing laws. The theory is that the legislature does not draft conflicting laws, so that judges do not make law by choosing between laws. The theory is that the legislature drafts clear laws so that judges do not make law by giving meaning to ambiguous laws. Like Justinian, Napoleon sought a code that was so clear, complete, and coherent that there would be no need for judges to deliberate publicly about which laws, customs, and past experiences apply to new, evolving situations. Furthermore, this approach required a high degree of procedural formalism to reduce the discretion of judges in regulating the presentation of evidence, witnesses, arguments, and appeals ... The French situation encouraged the development of easily verifiable “bright-line-rules” that do not rely on the discretion of judges ... Napoleon secured the adoption of the Code in all conquered territories, including Italy, Poland, the Low Countries, and the Habsburg Empire. Also, France extended her legal influence to parts of the Near East, Northern and Sub-Saharan Africa, Indochina, Oceania, French Guyana, and the French Caribbean islands during the colonial era. Furthermore, the French Code heavily influenced the Portuguese and Spanish legal systems, which helped spread the French legal tradition to Central and South America."

The French legacy is hence seen as the result of a revolutionary act to overcome the degenerations of the Ancien Régime, which, alas, went much too far, resulting in an overly formalised set of rules which left judges deprived of all discretion to address subtle issues.

However, not all civil law countries share this rigid approach to jurisprudence, the story is very different for the German branch of the civil law family:

"[It] was Bismarck’s decision in 1873 to codify and unify the whole of private law in Germany that led to the adoption of the German civil law in 1900... [but u]nlke in France, German courts have published (since at least the 16th century) comprehensive deliberations that illustrated how courts weighted conflicting statutes, resolved ambiguities, and addressed changing situations ... Through active debate between scholars and practitioners, Germany developed a dynamic, common fund of legal principles that then formed the basis for codification in the 19th century. Moreover, in contrast to the revolutionary zeal and antagonism toward judges that shaped the Napoleonic Code, German legal history shed a much more favorable light on jurisprudence and explicitly rejected France’s approach ... Whereas the Napoleonic code was designed to be immutable, the Bürgerliches Gesetzbuch was designed to evolve ... Thus, while codification had a similar role in Germany and France in unifying the country and reasserting the power of the central state, Germany had a very different approach toward jurisprudence ... The Austrian and Swiss civil codes were developed at the same time as the German civil code and the three influenced each other heavily. In turn, Czechoslovakia, Hungary, Yugoslavia, and Greece relied on German civil law in formulating and modernizing their legal systems in the early part of the 20th century. The German Civil Code was not imposed but exerted a big influence on Japan. At the end of the 19th century, Japan looked toward Europe as it sought to draft a commercial code ... Although Japan came under the influence of the Common law during the post World War II occupation period ..., it is not uncommon to classify Japan as a German civil law country, particularly when focusing on Commercial and Company law. Similarly, the German code influenced the development of commercial law in Korea, especially through the Japanese occupation. During the early decades of the
20th century, China (and hence Taiwan) examined European law in seeking to improve the operation of their commercial law. China introduced civil codes in 1925 and 1935 that ... were shaped by German civil law."

Finally, the law and finance theory distinguishes Scandinavian from German civil law, but it is not very explicit about the differences and their potential consequences. If anything, this literature stresses that Scandinavia – like Germany – rejected the legal traditions brought about by the French Revolution. Scandinavian civil law did not spread to other countries.

From the perspective of the law and finance theory, the countries belonging to the German branch of civil law family are obviously luckier than those from the French branch, since their legal system was initiated by a statesman, paying due respect to a flexible tradition, and not in a presumptuous attempt to wipe out all errors of the past and codify the future for good.

2.2 The theory's main conclusions and predictions

The original contribution of the law and finance theory is to incorporate its view of the history of law into a comparative analysis of investors' property rights protection. The theory's main conclusions and predictions result from the way in which the two transmission channels, the adaptability mechanism and the political mechanism, are affected by the highlighted characteristics of legal systems.

Recall that the theory characterises common law by protection of private property rights and a low degree of formalism. This will obviously lead to two straightforward conclusions. (1) Regarding the adaptability mechanism, this system is more adequate than a more rigid system to deal with financial contracts, which are contingent on a host of foreseeable and unforeseeable states of nature and business. (2) Regarding the political mechanism, a legal system that emphasises the protection of private property rights will be the best way to ensure investors' confidence, which is essential to the willingness to invest.

For the civil law family, the conclusions that derive from the theory of law and finance's specific view of the history of law are a bit more subtle. With respect to the adaptability mechanism, the revolutionary fury to wipe out jurisprudence and establish a permanent order of reason through codified, positive law must be seen as the antithesis to flexibility, but the German (and Scandinavian) systems are clearly looked at with more sympathy, since, though they are based on positive law, it is stressed that they rejected the radical French approach.

Accordingly, with respect to the adaptability mechanism, the theory of law and finance predicts a triple ranking of legal systems in terms of appropriateness to promote financial development: Common law should produce superior results, German and Scandinavian civil law intermediate, and French civil law is clearly the worst choice.

On the other hand, the political mechanism is expected to produce inferior outcomes in all countries that share the civil law legacy, so that for this dimension, we end up with only two groups of countries: common law countries that score high on private property rights protection and civil law countries that score comparatively low in this respect. Combining the rankings from the adaptability and the political mechanism, we nevertheless come to a clear overall ranking, which maintains the order resulting from the adaptability mechanism; but the political mechanism makes the difference between the common law and the civil law group more pronounced than the difference that stems from the adaptability mechanism alone.
Taken together, if one is willing to follow the theory of law and finance's interpretation of the history of law, the story told so far is intuitively plausible, though not to the same degree in all of its nuances. In particular, I find that the political mechanism is not very convincing. Let us hence take a closer look at how the proponents of the theory motivate this effect (Beck and Levine, op. cit., p. 13 f.):

"The political mechanism holds that the Civil law has tended to support the rights of the State, rather than private property rights ... with adverse implications for financial development. ... [C]ivil legal tradition ... can be taken as a proxy for the intent to build institutions to further the power of the State. A powerful State with a responsive civil law at its disposal will tend to divert the flow of society’s resources toward favored ends ... which is antithetical to competitive financial markets. Furthermore, a powerful State will have difficulty credibly committing to not interfere in financial markets, which will also hinder financial development."

In my opinion, what Beck and Levine are describing here is an interventionist state rather than a civil law country, and while it may be true that interventionist policy is encountered relatively more frequently in countries with a civil law tradition, the two phenomena may be fundamentally unrelated. An alleged causality between civil law and interventionism would hence merit more elaboration. How civil law would make the state prone to interfere with the functioning of financial markets, or how civil law would make it difficult to credibly commit not to interfere, remains very unclear.

To summarise: the theory of law and finance combines a specific interpretation of the history of law with two proposed mechanisms that may affect the willingness to invest. It predicts that common law countries should have a legal system that effectively guarantees the highest level of protection to financial investors, followed by Scandinavian and German origin civil law countries, whereas French legal origin should yield the poorest results.

2.3 Applications

A straightforward application of the theory is to compare investor protection across countries belonging to the different legal traditions, and this is precisely what LLSV undertake in their seminal papers. To this end, they collect and process information on commercial law and procedural regulations relating to shareholders and creditors from 49 countries. This exercise in comparative analysis of contemporary law results in eight variables that characterise various aspects of shareholder rights (six of them binary and two continuous), and in six variables that characterise creditor rights (five of them binary and one continuous). These variables are defined as follows (LLSV 1998, table 1):

**Shareholder rights**

*One share-one vote*: one if the Company Law or Commercial Code of the country requires that ordinary shares carry one vote per share, zero otherwise. Equivalently, this variable equals one if the law prohibits the existence of both multiple-voting and non-voting ordinary shares and does not allow firms to set a maximum number of votes per shareholders irrespective of the number of shares she owns; zero otherwise.

*Proxy by mail*: one if shareholders are allowed to mail their proxy vote; zero otherwise.
Shares not blocked: one if firms are not allowed to require that shareholders deposit their shares prior to a General Shareholder Meeting thus preventing them from selling those shares for a number of days; zero otherwise.

Cumulative voting: one if shareholders are allowed to cast all of their votes for one candidate standing for election to the board of directors (cumulative voting) or if there is a mechanism of proportional representation in the board by which minority interests may name a proportional number of directors to the board; zero otherwise.

Oppressed minority: one if minority shareholders are granted either a judicial venue to challenge the decisions of management or of the assembly or the right to step out of the company by requiring the company to purchase their shares when they object to certain fundamental changes, such as mergers, assets dispositions and changes in the articles of incorporation; zero otherwise. Minority shareholders are defined as those shareholders who own 10% of share capital or less.

Pre-emptive rights: one if shareholders are granted the first opportunity to buy new issues of stock and this right can only be waived by a shareholder vote; zero otherwise.

Extraordinary meeting: minimum percentage of ownership of share capital that entitles a shareholder to call for an extraordinary shareholders’ meeting. It ranges from one to 33%.

Mandatory dividend: equals the percentage of net income that firms are required to distribute as dividends among ordinary shareholders; zero for countries without such a restriction.

Creditor rights

Reorganisation: one if a reorganisation procedure imposes restrictions, such as creditors’ consent to file for reorganisation; zero for countries without such restrictions.

No automatic stay: one if a reorganisation procedure does not impose an automatic stay on the assets of the firm upon filing the reorganisation petition; zero otherwise

Secured first: one if secured creditors are ranked first in the distribution of the assets of a bankrupt firm; zero if non-secured creditors, such as the government and workers, are given priority.

No management stay: one if an official appointed by the court, or by the creditors, is responsible for the operation of the business during reorganization; equivalently if the debtor does not keep the administration of its property pending the resolution of the reorganization process; zero otherwise.

Legal reserve: minimum percentage of total share capital mandated to avoid dissolution of an existing firm; zero for countries without such restriction.

These indicators obviously capture interesting features of shareholders' and creditors' position in corporate finance. Now, to condense this information, LLSV propose two indices, which they call "anti-director rights" and "creditor rights". In particular, the anti-director rights index results from adding "Proxy by mail", "Shares not blocked", "Cumulative voting", "Oppressed minority", "Pre-emptive rights" plus one if "Extraordinary meeting" is less than or equal to 10% (the sample median). This index thus ranges from one to six. The creditor rights index results from adding the four binary creditor rights variables, i.e. "Reorganisation", "No automatic stay", "Secured first" and "No management stay". It hence ranges from zero to four.

Recall that the law and finance theory predicts that common law countries should perform better than civil law countries in protecting both shareholders and creditors, and that the
French legal legacy would produce the most unfavourable results. Comparing the index means across groups of countries belonging to the same legal tradition, this is exactly what LLSV read from their data. The common law countries show an average of 4.0 on the anti-director rights index, whereas the Scandinavian, German and French civil law country averages are 3.00, 2.33 and 2.33, respectively. Accordingly, as predicted, the common law countries seem to offer better shareholder protection on average than the civil law countries. Though the ranking within the civil law family is not exactly in line with the theory, which would have the French system perform worst, the evidence nevertheless seems favourable with respect to the basic distinction of law families. Regarding the creditor rights index, the common law countries on average score highest with 3.11, whereas the Scandinavian, German and French law family groups' scores are 2.00, 2.33 and 1.58. Accordingly, LLSV (1998: 1139) conclude that both indices support the law and finance theory and that it "is not the case that some legal families protect shareholders and others protect creditors."

This is an impressive finding. Accordingly, these indices are widely accepted as a verification of the first link in the theory of law and finance's causal chain that runs from legal origin to financial development.

As mentioned above, one of the indisputable merits of the law and finance theory is that it allows deriving unambiguous and testable predictions. This property holds also for the second of the theory's proposed links, the causal chain running from financial development to economic growth. Recent interest in the so-called finance-growth nexus was initiated by King and Levine's (1993) seminal paper that sparked an impressive number of empirical studies. Yet, the difficulty in finding adequate quantitative proxies for "financial development" and the argument that financial development could be a result rather than a cause of economic growth submitted most of the empirical work in this field to a strong suspicion of not adequately dealing with endogeneity. Now, the law and finance's prediction that the legal families should constitute the basis for a hierarchy of distinctively different levels of financial development provides a new and potentially very useful proxy variable for financial development. If a country's legal origin, which is certainly not driven by its recent growth performance, allows predicting its state of financial development, this variable can be used as an instrument for financial development. Ross Levine and his co-authors were quick to take notice of this and to incorporate the LLSV legal origin classification into the usual cross-country regression framework. The resulting two stage regressions were reported to work well, which means that this approach helped in reducing the suspicion of endogeneity bias which had plagued previous regressions that included proxies for financial development as a potential determinant of economic growth. Indeed, it is thus fair to assume that this exercise has greatly contributed to convince the profession to regard financial development as a causal factor in economic growth.

The law and finance theory is thus perceived as a major building block in the ongoing search for the ultimate sources of economic growth and development.

3 Previous critique

While the theory of law and finance is generally regarded as a major achievement and its key texts are now standard references in the field of finance and development, a number of scep-

---

4 See Levine (1999), Beck et al. (2000) and Levine et al. (2000).
tics have formulated their doubts. In this section, we shall discuss some of the typical criticisms that have been brought forward so far.

To start with, a frontal attack holds that the law and finance theory is a skilful piece of "pro markets" ideology, designed to deliver a rationale to the alleged superiority of the Anglo-Saxon model of corporate finance (Singh et al. 2001). While there may be some truth in this argument, this is certainly not sufficient to invalidate the theory and its findings, which are, as we have repeatedly stated, a set of hypothesis with indisputable empirical content. Reference to the proponents' intentions may help to assess the practical relevance of purely theoretical or speculative work, but empirical work is linked to facts.

To deconstruct empirical approaches, one can claim that the links are flawed, that the facts are flawed, or identify contradictory facts that falsify the theory, and indeed, the finance and law theory has been criticised along these three lines.

Some concerns have been raised about the law and finance theory's division into major legal families and about limited number of assignments of countries to a specific group that may be open to doubts. Yet, the classification is accepted as basically sound, so that this line of criticising is constructive and aims at eliminating minor deficiencies of the theory.

A more challenging critique refers to the observation that the major the legal systems were spread around the world together with the financial systems of the originating countries, so that the law and finance theory faces a fundamental identification problem. In particular, Fohlin (2000) shows that common law was generally imported together with the English financial system, so that the alleged causal impact of the legal tradition cannot be separated from the coincident transplantation of a wider range of institutions from England. What the theory attributes to legal origin should accordingly rather be interpreted as a result of the financial system that the country inherited.

Let us consider this point in some depth: the Anglo-Saxon financial system is usually described as "market-based" and "specialised", whereas the continental systems as well as Japan's are labelled as predominantly "bank-based" and "universal". Along these distinctions, there is a lively academic discussion about normative and theoretical questions, but it has proven notoriously difficult to construct corresponding empirical classifications of the world's financial systems. Nevertheless, at few attempts covering a reasonably large number of countries have been documented so far. On this basis, Levine (2002) performs extensive cross-country analyses to detect a possible supremacy of either market-based or bank-based financial systems, but he concludes that while there is evidence for the importance of the level of financial development, the type of system does not seem to matter. Demirgüç-Kunt and Maksimovic (1998, 2003) analyse firm-level data across countries and find that firms' access to external finance is positively related to the level of financial development, but not to the expansion of the capital market relative to the banking sector. Fohlin (2000) develops a classification of financial systems for 26 countries ranging back to the 19th century and concludes that until recently, the typology of financial systems was remarkable stable over time, but that economic history over the last 150 years does not support the view that any specific system provided a superior environment to achieve economic prosperity; in the long term, the legal system does not seem to have had any perceivable impact on economic growth.

5 See e.g. Berkowitz et al. (2003).
6 See e.g. Allen and Gale (1995) and Neuberger (2000).
Though these studies suffer from the inherent difficulty to classify the world's economies along a binary category, the fact that they fail to come up with significant outcomes with respect to "banking based" versus "capital market-based" supports the argument that it is the quality rather than the specific type of financial system that matters for growth and development. Hence, if legal origin were a reliable predictor for the quality of a country's financial system, the law and finance theory would indeed highlight an important link.

Let us hence turn to the sceptics that cast doubt on this link. A theory is flawed if other causes then those claimed by the hypotheses of the theory are responsible for an observable outcome. Though alternative, competing hypotheses for an observed phenomenon that are just as plausible, or even more plausible, than the original proposition, cannot falsify a theory, they can nevertheless contribute to make it seem less likely. Regarding the finance and law theory, this type of criticism has been brought forward in manifold ways. This critique thus takes it as a fact that common law countries protect investors better than German and Scandinavian civil law countries and that investor protection in these is in turn better than in French civil law countries, but it disputes that a country's legal origin is responsible for this outcome.

Along these lines, it has been argued that a "transplant effect", i.e. the way in which the original legal system was transferred to receiving countries, rather than the legal origin itself, is responsible for the quality of investor protection (BERKOWITZ ET AL. 2003).

Others have undertaken to show that LLSV's anti-director and creditor rights indices are better explained by a country's predominant religion rather than by its legal origin and conclude that the true causal chain runs from religion to investor protection (STULZ AND WILLIAMSON 2003).

Still others refer to cultural characteristics. LICHT ET AL. (2001) submit the LLSV data to a secondary analysis and find that cultural dimensions (measured by world wide socio-psychological surveys) are at least as effective as the legal origin in explaining the inter-country variation in the legal characteristics of the financial system. High scores on the anti-director rights index are associated with an English speaking country group that is to a large extent identical with the common law group and very similar in cultural terms. On the other hand, the cultural dimension performs better to distinguish between the high and low creditor rights country groups than the common versus civil law distinction. According to this finding, it seems more likely that common characteristics of the predominantly English speaking and common law country group go hand in hand with a comparable set-up of the stock market, but differences in credit and banking should be attributed to other factors than the legal tradition, such as national culture, which may, but need not, coincide with the inherited legal tradition.

Yet another argument refers to environmental conditions that would either make overseas colonies attractive for European settlers or would turn them into predominantly "extractive" colonies otherwise, which resulted in comparatively lower institutional quality in the latter than in the former (ACEMOGLU ET AL. 2001, 2002). The environment and the climate can accordingly be regarded as alternatives to legal origin in predicting institutional quality.\(^7\)

---

7 The proponents of the law and finance theory have been quite receptive to what they call the "endowment view" and rarely fail to mention this as an alternative explanation; see in particular BECK ET AL. (2003).
Furthermore, **Rajan and Zingales (2003)** argue that financial development has undergone major "great reversals" and while the common law countries nowadays tend to have more developed arm's length finance, in the beginning of the 20th century the civil law countries were more advanced in this respect. Their explanation is that civil law is likely to give more influence to important "incumbents" in shaping corporate law, and the great reversal of the 20th century was that in the initial free trade regime incumbents promoted financial development, whereas the breakdowns of the free trade regime during World Wars I and II and the protectionism they initiated made incumbents rather opt for financial repression\(^8\) to secure their rents.\(^9\)

Finally, a link between property rights and financial development can be addressed without imposing the legal origin paradigm that unifies the law and finance theory.\(^10\) This allows for more flexibility in accurately tracing differences in the factual quality of law, so that the results of this competing approach seem theoretically less appealing, but more informative from an applied point of view.

Taken together, I think it is fair to conclude that the presented alternative hypotheses to explain the different levels of investor protection, or in more general terms, the quality of the financial system, are indeed offering very plausible alternatives to the law and finance theory; but they cannot rule out that this theory refers to a relevant link between the legal tradition and financial development.

Now, recall that the finance and law theory claims to present two empirical findings in its support; (1) that the legal origin predicts the level of investor protection, and (2) that the legal origin helps explaining the level or quality of financial development. Before we proceed to our own evaluation of the facts, let us briefly turn to some arguments that question the second empirical pillar of the theory.

As indicated above, **Levine (1999), Beck et al. (2000)** and **Levine et al. (2000)** use various sets of LLSV type legal origin dummy variables or the creditor rights and shareholder rights indices and selected investor protection variables from LLSV as well as indices reflecting rule of law or accounting standards (let us denote such a variable set as \(L\)) to instrument for the usual financial development proxies \(X\) (M2/GDP, credit/GDP, indicators for stock market size relative to GDP or combinations thereof) in cross-country regressions of the growth rate of per capita income \(G\) on \(X\) and a number of control variables consisting of a widely accepted list of standard growth regressors \(Y\) and a further variable set \(Z\) that might likewise affect growth and serves to check for robustness of the point estimates for the \(X\) regressor. Since \(L\) is time invariant, the estimation is purely cross sectional and the observations relate to countries, where growth rates are averages over the whole time period considered, which due to data availability usually covers a few decades. In general terms, this approach can be written as

\[
G_i = \beta_0 + \beta_1 (X_i | L_i) \beta_2 Y_i + \beta_3 Z_i + \epsilon_i,
\]

---

8 See Shaw (1973) and McKinnon (1973) for seminal works on the concept of "financial repression".
9 The "great reversals" theory is another view that the finance and law theory has readily accepted as an important critique (see Beck et al. 2003). Yet, it is an extension of the law and finance theory rather than a critique, since it delivers a plausible story for the political mechanism which the original contributions fail to provide.
10 A large body of literature beyond the law and finance theory deals with institutions and growth; see e.g. Knack and Keefer (1995), Grogan and Moers (2001) and Claessens and Laeven (2002).
where \((X_i \mid L_i)\) denotes that the focal regressor \(X\) is instrumented for by the variable set \(L\). If the instruments are highly and meaningfully correlated with \(X\), but uncorrelated with \(G, Y\) and \(Z\), this instrumental variable approach is likely to reduce the suspicion of reverse causality and the resulting endogeneity bias.

Now, some sceptics maintain that the whole cross-country growth regression, which is drawing on sparse and often highly dubious data for a comparatively short historical period and basically assumes that all countries included (i.e. the US, the UK and Germany will be sampled together with other observations like Bolivia, Sudan or Nepal) are governed by the additive-linear same mechanisms that can adequately be captured in a multiple regression, is useless to derive any conclusions on the driving forces of economic development.\(^{11}\) Yet, many, if not most, economists will probably concede that this empirical framework has at least marginally helped in identifying major determinants of growth during the second half of the 20\(^{th}\) century and that it is worthwhile to improve it (rather than to abandon it), among other things, by econometric methods that might help to reduce the problems associated with the potential endogeneity of regressors.

However, in this particular case, the validity of the instruments can be disputed. Referring to a very limited number of mostly binary variables on legal origin and related institutional indicators as instruments for \(X\) presupposes that they are meaningfully related to financial development. Hence, the fact that they are statistically mildly\(^{12}\) correlated with the usual dubious\(^{13}\) indicators for financial development cannot be regarded as a proof of their adequateness as instruments for financial development. Moreover, another serious concern is that they might be weak instruments, which do not meet the requirements nowadays put forward by statisticians and econometricians.\(^{14}\)

I would hence conclude that the reported success of reference to legal system variables as instruments for financial development in cross-country growth regression is an interesting approach, which has the same problems and merits as most of the studies in this field. However these two-stage regressions cannot provide evidence that legal origin is a determinant of financial development – this is a requirement for the appropriateness of the instruments. Accordingly, the corner stone of the law and finance theory is and remains its proposition that different legal traditions imply different degrees of investor protection.

4 A new look at the data

Let us now take a look at the law and finance data originally put together by LLSV (1998) and referred to in an impressive number of both supporting and sceptical papers.

First, we shall briefly examine in how far the sceptics maintaining that what LLSV identify as the fundamental source of variation in investor protection is actually a distinction between the capital market-based, arms' length, English origin financial system versus the bank-based, relationship oriented, Continental origin financial system rather than the a distinction

\(^{11}\) See HARBERGER (1998) for an elaboration of these points.
\(^{12}\) When reported, the R's of auxiliary regressions of \(X\) on the \(L\) vector are hardly above 25\%, e.g. between .12 and .26 for the different proxies for \(X\) in LEVINE ET AL. (2000), which makes them jointly statistically significant in an F-test, but leaves an uncomfortable share of unexplained variance.
\(^{13}\) For a discussion of difficulties with the usual proxies for financial development, see e.g. GRAFF (2005).
\(^{14}\) See COVIELLO (1995) for an elaboration of this point.
between the origins of the legal family. To this end, we refer to an index developed by Demirguc-Kunt and Levine and designed to reflect the structure of a country's financial system in the late 20th century on a spectrum from more bank-based to more market-based and which Demirguc-Kunt and Levine recode into a binary market versus bank-based variable.\(^{15}\)

As mentioned above, it is notoriously difficult to propose a solid empirical decomposition of the world's financial systems into two groups, and different vintages of this variable actually differ in how a number of countries are classified, but any sensible attempt to get an empirical hold of the bank-based versus capital market-based dichotomy can only be welcomed. Referring to the binary variable "market" from the DEMIRGUC-KUNT AND LEVINE (2001) data supplement vintage, the common law countries' mean score equals .61, implying that 61% of the common law countries are classified as having market-oriented financial systems against only 39% that are classified as bank-based. For the civil law countries, the finding is practically reversed, 68% fall into the bank-based category and only 32% are classified as market-based. While this is clearly not a perfect correspondence of common law with market-based and civil law with bank-based, the difference is statistically significant, hitting the 5% level (F = 4.03).

Now, since "market" results from a dichotomisation of a continuous variable, this relatively clear result could be due to an arbitrary aggregation. It is easy to show that this is not the case. If we compare the group means for civil and common law countries of the underlying continuous structure index, the differences are statistically even more pronounced; the F-statistics jumps to 8.30, passing a 1% test for difference of group means.\(^{16}\) Accordingly, accepting that the structure index captures essential features of the bank-based versus market-based paradigm, the law and finance theory indeed faces an identification problem. However, since the correspondence is far from perfect, the legal family origin might still reveal essential features beyond the market structure paradigm.

Referring to the core argument of the finance and law theory, let us hence see whether there are differences in LLSV's measures of investor protection that are related to legal origin, but not to the type of financial system as classified by Demirguc-Kunt and Levine. To this end, table 1 shows the group mean scores for the anti-director rights index (srights) and the creditor rights index (crights) for common versus civil law countries and bank-based versus market-based financial system countries.

As can be seen from the left panel of table 1, the group means of LLSV's investor protection indices for shareholder rights (srights) and creditor rights (crights) are both higher for the common law countries. Moreover an analysis of variance confirms that both differences are statistically significant at the 1% level (F = 24.97 for the anti-director rights index and 13.05 for the creditor rights index, respectively). However, as the right panel of table 1 shows, the market-based financial system group still scores higher on the anti-director rights index,

---

\(^{15}\) The dummy variable "market" was first introduced by DEMIRGUC-KUNT AND LEVINE (1999). It is obtained by recoding one for positive and zero for negative values of a continuous "structure index", where the latter is the average of the deviations from the mean for (1) the inverse of the size of banking sector relative to stock market (approximated by deposit money bank assets divided by stock market capitalisation), (2) the inverse of activity of banking sector relative to stock market (approximated by claims on private sector by deposit money bank divided by total value traded) and (3) the efficiency of stock markets relative to the banking sector (approximated by total value traded as share of GDP * overhead costs). Higher values are supposed to indicate a more market-based financial system.

\(^{16}\) This improvement in correspondence can also be shown by comparing the non-parametric (Spearman) correlation between a dummy variable for civil law countries and the "market" dummy (.28) and the underlying structure index (.40).
but lower on the creditor rights index. For the anti-director rights index, the difference is again statistically significant (F = 6.59), but not for the creditor rights index (F = .73, corresponding to p = .4). Nevertheless, the group means of the creditor protection are contrary to what one would expect if one held the market-based type of financial system for superior in both shareholder and creditor protection.

Accordingly, in as much as we are prepared to put trust in the LLSV investor protection indices and the financial system classification by Demirguc-Kunt and Levine, we must conclude that market oriented financial systems protect shareholders better than bank-based financial systems, but not creditors, where the difference is rather tipping to the other side. In other words, the law and finance theory indeed appears to explain a general superiority of investor protection in common law countries that the financial system type distinction fails to account for. This is a neat result, but as we have stressed, it rests on the assumption that the financial system classification as well as the investor rights indices are valid instruments to capture what they are designed to.

We leave the financial system classification for another paper and now proceed to our final step, a re-assessment of the theory of finance and law’s original measurement of investor rights. To emphasise, apart from the taxonomy of legal systems, the comparative assessment of the legal framework in terms of investor protection is the very empirical basis of the law and finance theory and its best accepted building block.

Our starting point is that in another paper, it is shown that with few minor, but sensible modifications to the way in which the LLSV anti-creditor rights index aggregates the underlying information, the relative difference between the group means of civil law and common law countries diminishes considerably and becomes statistically insignificant (GRAFF 2006).18

---

17 To my best knowledge, apart from GRAFF (2005), no other paper has so far tried to elaborate this point.

18 The complete list of modifications that practically eliminate the inter-group difference (1.94 for common law versus 2.11 for civil law as compared to 2.42 versus 4.0 in LLSV’s original index, with a drop in the F-statistics from 25 to .18, corresponding to p = .67) are: (1) a minor modification of the “extraordinary meeting” dummy variable (for description of the indicators, see section 2.3 of this paper), which is originally measured on a numerical scale. The modification is to assign one if the requested share to call in an extraordinary meeting is less rather than less or equal (as in LLSV) than the sample median, which is preferable, since it splits the sample into groups that are closer to each other in numbers; (2) to exclude the “proxy by mail” and the “shares not blocked before meeting” dummy variables, that reflect the easiness with which shareholders can cast their votes. It is argued that the small public shareholder is rational to be apathetic and what matters is whether large minority shareholders have a voice. Given that the latter are mostly institutional investors, the provisions captured by the excluded dummies are practically irrelevant;
However, this addresses only the shareholder dimension of investor protection, for which, as we have demonstrated above, the law and finance paradigm is no improvement over the market-based versus bank-based financial system distinction. Recall that the law and finance theory does not discriminate between shareholder and creditor protection in that it predicts that common law countries should perform better than civil law countries in both respects. Moreover, it goes beyond the distinction between common law and civil law countries in postulating a ranking within the civil law family that puts Scandinavian and German legal legacy countries clearly above the French legacy group. Finally, given that the proponents of the theory consider their argument to be empirically best supported by international comparison of shareholder protection,\footnote{19} we can refer to original comparison of the anti-director rights index in LLSV (1998) to conclude that since measured shareholder protection is better in Scandinavian countries than in German law legacy countries, a consistent ranking would place the former above the latter in all dimensions of investor protection. Consequently, the law and finance theory would predict a general ranking in terms of investor protection on an ordinal scale that has common law countries first, followed by the Scandinavian group, then the German law legacy group and finally the French civil law countries.

These considerations can readily be translated into a testable hypothesis: If the indicator set on investor protection put together by LLSV consisted of various aspects that reflect investor protection along a common dimension, a factor analysis should confirm that the total variance of the indicators can reasonably be attributed to a single factor. Since statistically, for a one factor solution subsequent factors, involving rotation and possible relaxations of orthogonality constraints are not relevant, we perform a principal component decomposition to extract the first factor. In particular, we take the original indicators from LLSV (1998); consisting of eight shareholder protection and five creditor protection indicators and covering 49 countries, select the ten indicators that LLSV chose to include into their indices and perform a principal component analysis, imposing a one factor solution.\footnote{20}

However, the result is clearly not a one factor solution; the first principal component reproduces no more than 26% of the indicator set's variance, and as table 2 shows, three out of ten loadings (i.e. correlations of the variables with the first principal component) are negative, whereas LLSV consistently assign higher values to their indicators for better protection. Furthermore, the communalities (i.e. the squared factor loadings, indicating the shares of variance of the indicators reproduced by the first component) show that some of the indicators do virtually not have anything in common with the first component. Accordingly, this casts doubt on the adequacy of this data to support a single dimensioned notion of investor protection.

So, if it does not seem sensible to reduce the variables into one dimension, how about two dimensions? Recall that though LLSV claim that investor protection should follow the same (3) to include LLSV's conceptionally convincing "one share-one vote" dummy variable that curiously does not enter into the original anti-creditor rights index; (4) to include the "mandatory dividend" indicator, reflecting a legally required minimum dividend, which LLSV call a "remedial" protection and exclude from their index. It is argued that a distinction between "remedial" and other protection is not warranted.

\footnote{19}{See BECK and LEVINE (2003).}

\footnote{20}{Given that the "extraordinary meeting" variable is measured on a numerical scale, we do not dichotomise it, which preserves the original information. Moreover, since principal components extraction requires a complete data set, the number of observations analysed is 46, as three countries have at least one missing value in the LLSV data set. To check for robustness, we completed the data by substituting the legal family group means for the missing values and repeated all reported principal components with 49 observations. The results remained qualitatively unchanged.}
legal family ranking regarding both shareholders and creditors, they divide their indicators into shareholder related and creditor related and actually propose two different indices for measuring investor protection. Let us hence repeat the principal component extraction, this time imposing a two factor solution. After rotation, grouping of the indicators into shareholder related and creditor related, and suppressing factor loadings below an absolute value of .5 to ease interpretation, we summarise the results of the two factor solution in table 3.

As can be seen from table 3, there is some support for a two factor solution. High loadings with an absolute of at least .5 appear on two factors related to the two groups of indicators. The first principal component is related to creditor protection related indicators and the second to shareholder protection related indicators. However, while the signs are equal for the high loadings on the first component, we encounter two positive and one negative high loading for the second component, and three out of six shareholder protection indicators as well as one of four creditor protection indicators do not load high on their respective components. Moreover, the first two components reproduce no more than 42% of total variance. A standard principal component analysis would extract two additional factors with eigenvalues greater than one, accounting for 66% of the total variance, where the rotated factor loading matrix (see table 4) does not suggest any obvious interpretation. Accordingly, if we impose a two dimensional structure on the indicator set, the results are less unsatisfactory that for an imposed one factor solution, but the presence of indicators that are largely uncorrelated to any of the components, contributing to a low degree of explained total variance, as well as a wrong sign on one of the components suggest that we should not regard the indicator set as two dimensional.

Now, if a data set does not reveal a clear structure, it is not obvious what meaning one should attach to an aggregation of this data. Moreover, under such circumstances, minor differences in indicator selection, weighting or scaling of single items may considerably change any resulting aggregate measure, so that we should not expect particularly robust results.

Keeping this in mind, let us now have a closer look at LLSV's creditor rights index. The principal components extraction with two imposed factors implied that though not all of the four indicators in the creditor rights index are highly correlated to the related component, the signs were as expected. In particular, LLSV provide the following creditor rights indicators: (1) "Reorganisation" ("reorg" in tables 2–4), which is one if a firm's reorganisation needs creditors' consent, zero otherwise; (2) "No automatic stay" (autostay), which is one if a reorganisation does not impose an automatic stay on the assets of the firm, zero otherwise; (3) "Secured first" (secured1), which is one if secured creditors are ranked first in the distribution of the proceeds of a bankrupt firm, zero if non-secured creditors, such as the government and workers are coming first; (4) "No management stay" (manages), which is one if an official appointed by the court, or by the creditors, is responsible for the operation of the business during reorganization, zero otherwise; (5) "Legal reserve", which is the minimum percentage of total share capital mandated to keep to avoid dissolution of a firm, zero otherwise.

The creditor rights indicator set appears intuitively plausible. All creditor rights indicators are directly concerned with how well creditors are protected from a firm going bankrupt and stripping them of part of, or all of, their claims, which is the major concern for outside creditors who are entitled to fixed claims otherwise.

However, as with the proposed shareholder rights indicators, not all of them are included into the corresponding indices, so that some information is dropped upon aggregation. Regarding the creditor right index, the information thus disregarded is the legal reserve capital requirement to avoid dissolution. (LLSV 1998, p. 1135) call this a "remedial" creditor right. "It protects creditors who have few other powers by forcing an automatic liquidation before all the capital is stolen or wasted by insiders." Now, the group mean for the common law countries is 1%, whereas it is 16%, 41% and 21% on average for the Scandinavian, German legal legacy and French legal legacy counties, respectively. In other words, this creditor rights protection indicator scores by far lowest for the common law countries, which actually contradicts the law and finance theory. However, with the qualification that it protects "creditors who have few other powers", LLSV interpret it as a "remedial" that is in place to protect investors when other kinds of protection, that must implicitly be superior, are absent. Mildly put, I find this interpretation questionable. It appears very much like an ad hoc rationalisation of an unexpected result. If one wants to illustrate that the common law legal family is providing superior investor protection, a strategy to immunify oneself against evidence of the contrary is to dismiss it as a proof of one's prior belief, claiming that it merely a last resort and hence an indication of weakness.

At any rate, LLSV do not seem too convinced of their interpretation, since they do not include this indicator into their creditor rights index. After all, their interpretation would imply that out of all indicators for creditor protection, this particular one had to be entered with a negative sign, which might have made the referees intervene, or if they would buy it, be detrimental to the reception of the story.

21 For a similar concern about a "remedial" variable in LLSV's shareholder rights indicator set, see Graff (2005).
I now suggest not to ignore this information, but to take it as it is, at face value, a legal device to protect outside creditors to be stripped by insiders. Accordingly, let us now recalculate the creditor rights index with all five indicators and see how this changes the results. Table 5 shows the group means for the LLSV creditor rights index and the recalculated ("amended") index by civil law versus common law legacy.

Obviously, the alleged superiority of the common law countries in protecting creditor rights is considerably reduced when we add the legal reserve requirements indicator that LLSV exclude for unconvincing reasons. Moreover, the difference between the groups, which is significant for the original index (F = 13.0), turns insignificant after our recalculation of the index (F = 1.84, corresponding to p = .18).

The changes resulting from our recalculation of the creditor rights index are even more striking when we look at the complete rank ordering of the legal families suggested by the law and finance theory than only at the common versus civil law countries. The results are presented in figure 1, which plots the means values for the LLSV creditor rights index (on the left of each double bar) and our amended index (on the right of each double bar) for the common law family (rank 1), the Scandinavian family (rank 2), the German law family (rank 3) and the French law family (rank 4).

As can be seen in figure 1, the original LLSV creditor index scores highest for the common law countries, which implies that it is not only higher in for the common law countries compared to the civil law group as a whole, but higher than in each individual subgroup of the civil law group. Moreover, though the rank order predicted by the law and finance theory does not manifest itself perfectly in the LLSV creditor rights index, a test for linearity is passed at the 1% level (F = 13.73). Furthermore, the four indicator mean values could be brought in line with theory's prediction by putting the German group before the Scandinavian countries, which would not touch the essence of the theory.

The recalculated index, however, stands in clear contradiction to the law and finance theory, since the common law countries rank inferior to the German law legacy group; and the imposed linearity does not pass the test for linearity at the 10% level (F = 2.73).

---

To make its scale comparable to the other indicators in the creditor rights index, I follow LLSV’s general approach and dichotomise it, in this case by assigning one if the reserve requirement is greater than 0% and one zero if there is no such requirement, which splits the sample neatly in 43% countries that score zero versus 57% that score one.
Finally, we note that LLSV (1998: 1138) concede that the "United States is actually one of the most anticreditor common-law countries." In other words, the predictions of the law and finance theory do not hold for creditor protection in the German origin country group, which does better than the common law countries, nor for the US, the herald of property rights and investor protection, which finds itself close to the bottom.

I conclude that this re-assessment of the law and finance theory's empirical foundations reveals that they are built on dubious statistical aggregations, and once we correct these, it not the predictions fail to meet the facts. Accordingly, the validity of the LLSV anti-director rights and creditor rights indices for international comparisons of shareholder and creditor rights, the supremacy of the common law legacy in protecting investors and, consequently, the validity of legal origin variables to instrument for financial development, have to be regarded as myths rather than truths.

5 Summary

The "law and finance theory" identifies two dominating legal traditions, a common law tradition inherited from England, and a civil law tradition that is going back to 19th century codifications in France, Germany and Scandinavia. Another key notion of the theory is the distinction between insiders (stakeholders, "the State") and outsiders (shareholders as well as creditors). The micro foundation of this approach is the willingness to invest. The innovative addition of the law and finance theory to these ideas lies in the way it combines them with its peculiar view on legal history. The major conclusion of this theory is that the common law system provides the best basis for financial development and economic growth, followed by Scandinavian and German origin civil law and finally French origin civil law. Moreover, since the law and finance theory has been referred to in using legal origin as instrument for financial development in cross-country growth regressions, it is perceived as major building block in the ongoing search for the ultimate sources of economic growth and development.

This paper argued that the theory faces an identification problem, since the majority of common law countries have a market-based financial system, whereas the majority of civil
law countries have a bank-based financial system. However, since the correspondence is far from perfect, the legal family origin might still reveal essential features beyond the market structure paradigm. Furthermore, we summarised plausible alternative hypotheses to explain the different levels of investor protection, or in more general terms, the quality of the financial system; but concluded that they cannot rule out that the theory refers to a relevant link between the legal tradition and financial development.

Finally it was argued that the cornerstone of the law and finance theory is the proposition that different legal traditions imply different degrees of investor protection. It was then shown that the original and widely accepted data set to support this claim does not have a low dimensional structure, so that it is not obvious what meaning one should attach to an aggregation of this data. Moreover, under such circumstances, minor differences in indicator selection, weighting or scaling of single items may considerably change any resulting aggregate measure. It then was demonstrated that a few minor, but sensible modifications in aggregating the original indicator set indeed produce results that are very different from those brought forward in support of the theory and contradictory to the proposed ranking of the four major legal families in terms of investor protection.

Accordingly, the validity of the LLSV anti-director rights and creditor rights indices for international comparisons of shareholder and creditor rights, the supremacy of the common law legacy in protecting investors and, consequently, the validity of legal origin variables to instrument for financial development, have to be regarded as myths rather than truths.
