Old Galaxies at $z > 1$

P. J. McCarthy

Carnegie
Observatories

ETH

Aug 21, 2003

Conference

Las Campanas IR Survey

1 square degree $K < 20.8$

Chen, Marzke, Carlberg, Persson, Abraham
Bridge, Ellis, Bunker

Gemini Deep Deep Survey

Abraham, Glazebrook, McCarthy

Crampton, Savaglio, Chen, Hook,
Marzke, Roth, Jorgensen,
Murowinski

GOALS

- Galaxy Assembly in the $1 < z < 2$ Epoch
- Space density of massive galaxies
- Stellar evolution in early type galaxies
- Evolution of 3-D Clustering

Approach

- Multi-color optical & near-IR imaging survey
- Depths keyed to $z = 2$ elliptical: $K_s \sim 21$!
- Photometric & spectroscopic redshifts
- Six fields – 1 square degree total area

CIRSI + LCO Wide Field IR Camera

du Pont 2.5m telescope
4 1024 x 1024 arrays
cryogenic Offner relay
16 channel electronics

4 1024x1024 detectors – 90% gaps

4 pointings – 16 1024 x 1024 images

4 pointings – 16 1024 x 1024 images

4 pointings – 16 1024 x 1024 images

100,000

1024 x 1024

Frames - 30
seconds each

13' x 13' mosaic – 3 hour exposure

Red Galaxies are Abundant

Photometric Redshifts from LCIR

H.-W. Chen et al
in prep

$$\sigma(z)/(1+z) = 0.08$$

Color-Color Diagrams

- Stars form distinct sequence
- $Z > 1$ galaxies appear at $K \sim 19$
- $Z > 1.5$ galaxies at $K \sim 20$
- Reddest galaxies follow minimal evolution track

$K < 20.8$

Structure at $Z = 1$

Abraham et al.

Clustering Scale Length

- Angular clustering length $\sim 12''$
- $\langle z \rangle = 1.2$ $\sigma(z) \sim 0.15$
- $r_0 \sim 9 h^{-1}$ Mpc co-moving

Comparable to or larger than the most strongly clustered populations today

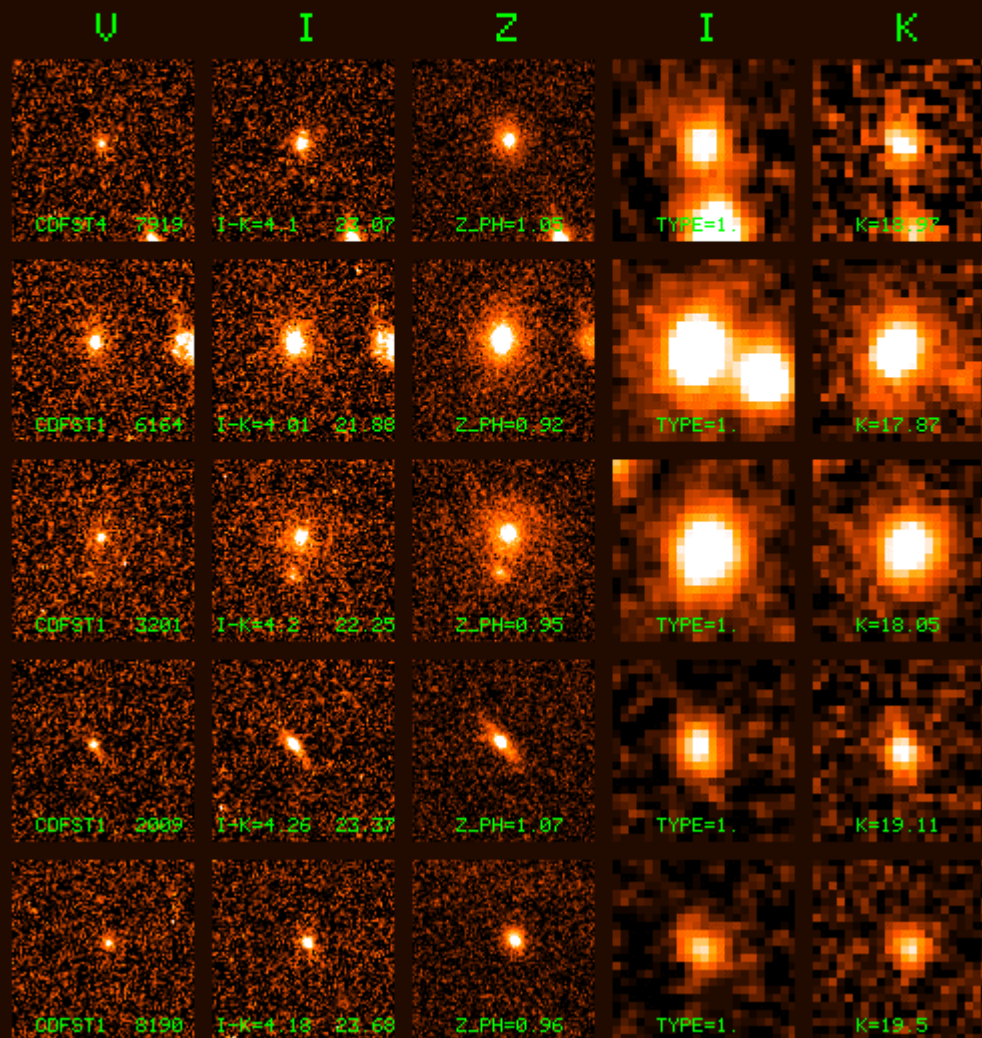

Note - LBG scale length $\sim 2-3h^{-1}$ Mpc

Daddi et al. (2001,2003); McCarthy et al. (2002)

Morphologies of Red Galaxies

$$4.0 < I - K < 4.5 \quad \langle z \rangle = 1.0$$

Template type 1 (E/S0)

85% Compact 10% Disks 5% Diffuse

See Stiavelli
& Treu 1999
NICMOS results

Template type 2 (Sab/Sbc)

60% Compact 35% Disks 5% Diffuse

$$4.5 < I - K < 5.0 \quad \langle z \rangle = 1.2$$

Template type 1 (E/S0)

60% Compact 25% Disks 15% Diffuse

See
Yan & Thompson
2002
WFPC2 results

Template type 2 (Sab/Sbc)

40% Compact 30% Disks 30% Diffuse

Evolving Luminosity Functions

- LFs derived from photo-z's with modified likelihood approach
- LF at intermediate z agrees well with CNOC2
- Very little apparent evolution in L^* to $z \sim 1.2$

Rest-Frame R-and Luminosity Density

Chen et al.
2003

Little or no evolution to $z \sim 1.3$

[OII] Redshifts from GDDS

Color Evolution

Color Evolution

Color Evolution

Color Evolution

Are the Red galaxies the descendants of the LBGs?

- Clustering ✗
- Color evolution ✗ ?
- Spectral Shapes ✓
- Masses ?

If not, what are the progenitors?

sub-mm sources? red J-K galaxies?

Conclusions

- $I-K > 4 \rightarrow z > 1$
- Progenitors to Local E's have been found
- Little or no Evolution in Mass Density
Since $Z \sim 1.5$
- Old Stellar Populations at $z \sim 2$
 \rightarrow *Large Formation Redshifts*
